

Automated Network Request Management

SCENARIO Submitting, approving, and completing a network access or change request through the automated ServiceNow workflow													+	→	⚙️	→	⌚							
Entice How does someone initially become aware of this need?													Enter What do people experience as they begin the process?	Engage In the core moments in the process, what happens?	Exit What do people typically experience as the process finishes?	Extend What happens after the request is fulfilled?								
Steps What does the person typically experience?													Business need identified A project or incident creates the need for a network change or access	Log into ServiceNow portal Requester signs into the employee portal using single sign-on	Search & select request item Requester searches the catalog for the right item (URL, IP/email, new connect)	Complete guided request form Dynamic form asks only relevant questions for the request type	Submit request Requester reviews a summary and submits, a ServiceNow number is generated immediately	Automated validation & routing Workflow engine checks the request against CMDB and policy then routes it	Automated approval workflow Requester auto-routes to the right approver, with reminders for pending items	Automated provisioning Once approved, orchestration pushes the change directly to network devices	Completion notification Requester and approver are notified the change is complete	Verify access or change Requester tests the new access or change to confirm it works as expected	Rate the experience A short CSAT survey asks the requester to rate the process	Request history & reporting The request joins history, data feeds, dashboards for the network team
Interactions People, places, and things involved at each step													Project manager or team lead planning kick-off incident ticket	ServiceNow Employee Center: SSO / Identity provider	Service catalog search bar and category filters	Smartdynamic catalog form: CMDB lookups, variable sets	Confirmation screen: RTM number, email notification	Flow Designer / integrationHub: CMDB, policy engine	Approver: approval notification (email/SMS), approval record	Network orchestration / integrationHub: firewall, VPN, SD-WAN devices, CMDB updates	Email/mobile notification; ServiceNow ticket update	Requester's own device/application; the network resource itself	Survey notification; ServiceNow Employee Center	Performance Analytics / reporting; request history page
Goals & motivations What is the person's primary goal? ("Help me...")													Help me recognize exactly what network change I need	Help me get in quickly without another password	Help me find the exact request type without guessing	Help me fill this out correctly the first time	Help me know my request was received	Help me avoid delays caused by manual data-entry errors	Help me get approved fast without chasing people down	Help me get this done without waiting or someone to type it in manually	Help me know exactly what I can start using this	Help me confirm this before I rely on it	Help me quickly share feedback without a long survey	Help me see all my past requests in one place
Positive moments What's enjoyable, fun, or surprising?													Single sign-on makes access instant	Catalog is organized by category and searchable	Form only shows fields relevant to my specific request	Instant confirmation with a tracking number	No more waiting on someone to manually check policy compliance	Automatic reminders reduce the need to follow-up manually	Change is applied within minutes instead of days	Clear notification tells me it's ready to use	One-click rating is fast	Full visibility into request history builds trust in the system		
Negative moments What's frustrating, confusing, or costly?													Unlock which catalog item actually covers my specific need		Too many similar-sounding catalog items cause confusion	Some technical fields (e.g. CIDR ranging) are unclear to non-network staff		When validation fails, the reason given is sometimes too generic	Approvals stall when an approver is out of office with no delegate set	None: orchestration failures have an unclear escalation path		No easy way to report a problem if it doesn't work correctly	Survey fatigue leads to low response rates	
Areas of opportunity How might we make each step better?													Add a short needs assessment section that recommends the right catalog item		Use guided catalog builder with plain-language labels and spreadsheet search	Add inline help text and examples for technical fields		Return specific, actionable validation error messages	Auto-detect out-of-office status and route to a backup approver	Add automatic retry and a clear escalation path when orchestration fails		Add a one-click "This isn't working better" that requests the ticket with diagnostics	Shorten the survey further and vary its timing and channel	Surface trend dashboards to flag recurring request types for further automation
