

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	4 September 2026
Team ID	Servicenow
Project Name	Automated Network Request Management
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution — an Automated Network Request Management application built on ServiceNow, covering service catalog submission, approval routing, automated fulfilment, notifications, and reporting.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration & Login	Login via corporate Single Sign-On (SSO) Login with Service Portal username / password Self-service password reset
FR-2	Service Catalog Browsing	Browse the Network Service Catalog by category Search catalog items by keyword View catalog item description, variables, and expected SLA
FR-3	Request Submission	Submit a request by filling the catalog item form (variables) Attach supporting documents (e.g., manager authorization) Save an incomplete request as a draft and resume later
FR-4	Request Validation & Auto-Population	Auto-populate requester details (name, department, location) Enforce mandatory fields via UI Policies / Catalog Client Scripts Validate requested configuration against network inventory and policy rules
FR-5	Approval Workflow	Route standard requests for manager approval Route high-sensitivity requests for network security approval Support group / department-based approvals Allow an approver to delegate authority when out of office Auto-escalate requests not actioned within the defined SLA
FR-6	Automated Fulfilment	Auto-create a fulfilment task (u_network_task) once a request is approved Auto-provision standard, low-risk network access without manual intervention Route requests that fail automated provisioning to the Network Fulfilment Team as an exception
FR-7	Notifications	Send an email notification on every RITM status change Send an in-app notification on the Service Portal Send an SLA-breach escalation notification to the next approver
FR-8	Request Tracking	View real-time status of a submitted request (RITM) on the portal View complete request history for the logged-in user Cancel / withdraw a request that is still pending approval
FR-9	Reporting & Audit	Generate SLA-compliance and turnaround-time reports View a complete audit log of every action taken on a request Export reports to CSV / PDF, filterable by date range and department

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-10	Access Revocation	Auto-revoke / expire provisioned access on the date specified in the request Allow a network admin to manually revoke access before the expiry date

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The Service Portal catalog item form must be simple and guided (dynamic show/hide fields, inline help) so a first-time requester can complete a request in under 5 minutes without training.
NFR-2	Security	All access must be enforced through role-based ACLs; approvals must maintain segregation of duties; catalog variables and custom tables (u_network_database, u_network_task) must encrypt sensitive data at rest and in transit, and every action must be logged for audit.
NFR-3	Reliability	Automated approval routing and fulfilment flows (Flow Designer) must complete successfully for at least 99.5% of standard requests without requiring manual admin intervention; failed flows must fall into a monitored exception queue rather than fail silently.
NFR-4	Performance	The catalog item form must load within 3 seconds; approval notifications must be sent within 1 minute of a state change; automated provisioning for standard requests must complete within the defined SLA (e.g., 15 minutes).
NFR-5	Availability	The ServiceNow instance and the Automated Network Request Management application must be available 99.9% of the time, excluding scheduled maintenance windows, with status/maintenance notices posted on the Service Portal.
NFR-6	Scalability	The solution must support a growing volume of concurrent requests (e.g., up to 500 requests/day) without performance degradation, and must allow new catalog items, approval chains, and fulfilment task types to be added with configuration only, not custom code.
