

Project Design Phase Proposed Solution Template

Date	4 September 2026
Team ID	Servicenow
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Network-related requests such as firewall access, VPN provisioning, IP allocation, and new device setup are still raised through emails, calls, or unstructured spreadsheets. - Requesters get no visibility into approval status or expected turnaround (SLA). - Approvals and fulfilment are handled manually, causing delays and inconsistent prioritisation. - Manual re-entry of the same data across tools leads to errors and rework. - Lack of a single audit trail makes compliance reporting difficult and time-consuming. - The network/IT team is overloaded with repetitive, low-value administrative tasks instead of core network work.
2.	Idea / Solution description	Build an Automated Network Request Management application on the ServiceNow platform that digitises the entire request lifecycle: - A Service Catalog with structured request items (firewall access, VPN access, IP/subnet allocation, device/port provisioning, network change request). - Flow Designer / Workflow-driven multi-level approvals routed automatically based on request type, risk, and requester's department. - Integration with CMDB and network management/monitoring tools via REST APIs for automatic validation and, where possible, auto-provisioning. - SLA definitions with automatic escalation and email/Slack/Teams notifications at each stage. - A requester-facing dashboard and Virtual Agent chatbot for raising requests and checking real-time status. - Built-in reporting and audit trail for every request, approval, and fulfilment action.
3.	Novelty / Uniqueness	- End-to-end automation rather than simple digital ticketing — includes dynamic, risk-based approval routing instead of a fixed approval chain. - Direct integration with network infrastructure/CMDB enables auto-provisioning of low-risk requests without manual intervention. - Real-time SLA tracking with proactive escalation, rather than reactive follow-ups. - Single unified platform that replaces fragmented email, spreadsheet, and phone-based workflows across teams. - Self-service chatbot (Virtual Agent) for status checks and request creation, reducing helpdesk load.
4.	Social Impact / Customer Satisfaction	- Reduces employee wait time for network access, improving overall productivity. - Gives requesters full transparency into where their request stands, reducing frustration and repeated follow-ups. - Reduces manual workload and burnout for the network/IT support team, letting them focus on higher-value work.

S.No.	Parameter	Description
		- Improves organisational security posture through consistent, auditable approval and access-provisioning processes. - Builds greater trust in IT service delivery across the organisation through faster, more reliable fulfilment.
5.	Business Model (Revenue Model)	The solution can be offered as a ServiceNow-based application/managed service using a subscription and services model: - SaaS subscription priced per fulfiller/agent seat or per number of monthly requests, with tiered plans (Basic, Standard, Enterprise). - One-time implementation and customisation fee for integrating with the client's existing network tools and CMDB. - Annual Maintenance Contract (AMC) for support, upgrades, and enhancements. - Optional listing on the ServiceNow Store as a certified app for wider distribution and licensing revenue.
6.	Scalability of the Solution	- Built natively on the cloud-based ServiceNow platform, allowing it to scale from a single department to an enterprise-wide deployment without infrastructure changes. - Catalog and workflow design can be extended to other IT request types (server, storage, cloud resource provisioning) beyond networking. - API-based integration layer allows onboarding of additional network vendors, tools, and CMDB sources over time. - Role-based access and multi-department/multi-location support make it suitable for organisations of any size, including multi-site enterprises. - Reporting and analytics scale automatically with data volume, supporting growing request loads.
