

User Acceptance Testing (UAT) Template

Date	4 September 2026
Team ID	Servicenow
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

Project Overview:

Project Name: Automated Network Request Management in ServiceNow

Project Description: A ServiceNow-based application that lets employees raise network-related requests (firewall access, VPN, IP allocation, device provisioning) through a self-service catalog, routes them through automated, risk-based approval workflows, and fulfils low-risk requests automatically through integration with network systems.

Project Version: v1.0

Testing Period: 20 Nov 2022 to 21 Nov 2022

Testing Scope:

- Service Portal login/authentication and Virtual Agent (chatbot) request intake
- Service Catalog network request items, form validation, and file attachments
- Approval workflow routing, multi-level approval, and SLA-based escalation
- CMDB validation of configuration items referenced in a request
- Integration Hub / MID Server-driven auto-provisioning for low-risk requests
- Notifications to requesters on approval, rejection, and fulfilment
- SLA dashboard, reporting, and audit trail accuracy
- User stories USN-1 to USN-25 from the Product Backlog (Sprints 1–4)

Testing Environment:

URL/Location: <https://<instance-name>.service-now.com> (UAT sub-production instance)

Credentials (if required): Provided separately to each UAT tester (role-based: Requester, Approver, Fulfiller, Auditor)

Test Cases:

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-01	Login via Company SSO	Navigate to the Service Portal URL. Enter valid SSO credentials. Click Login.	User is authenticated and redirected to the Service Portal home page.	User authenticated successfully and landed on the Service Portal home page.	Pass
TC-02	Invalid Login Attempt	Enter incorrect username/password. Click Login.	System displays an error message and denies access.	Error message "Invalid credentials" shown; access denied as expected.	Pass
TC-03	Browse & Select Network Catalog Item	Navigate to Service Catalog. Search "network". Select "Firewall Access Request".	Catalog item form opens with the correct fields for the selected request type.	Catalog item opened with all expected fields (source, destination, port, business justification).	Pass
TC-04	Submit Request with Mandatory Fields	Fill all required fields on the catalog form. Click Submit.	Request (REQ) record is created and a confirmation with the request number is shown.	Request REQ0010042 created; confirmation screen displayed with request number.	Pass
TC-05	Submit Request with Missing Mandatory Field	Leave a required field blank. Click Submit.	Form displays a validation error and blocks submission.	Validation error shown under the blank field; submission blocked as expected.	Pass

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-06	Attach Supporting Document	Open a request form. Click Attach. Upload a file. Submit.	File is attached successfully and visible on the request record.	File uploaded and visible in the Attachments panel of the request record.	Pass
TC-07	View Real-Time Request Status	Open "My Requests". Select a previously submitted request.	Current status (e.g., Pending Approval, In Progress, Closed) is displayed accurately.	Status displayed as "Pending Approval", matching the actual workflow stage.	Pass
TC-08	Raise Request via Virtual Agent	Open the chatbot. Type "raise network request". Follow the guided prompts.	A request record is created, matching what the catalog form would create, with confirmation shown.	Request created via chatbot with the same fields as the portal form; confirmation given.	Pass
TC-09	Approval Routing by Risk Level	Submit a high-risk request (e.g., firewall rule change). Check task assignment.	Request is routed to both the Manager and Security approver per the approval matrix.	Approval tasks generated for both Manager and Security approver as configured.	Pass
TC-10	Approve / Reject with Comments	Approver opens the pending approval task. Adds comments. Clicks Approve.	Request moves to the next workflow state and the approver's comments are saved on the record.	Request moved to "Approved" state; approver comments visible on the record.	Pass
TC-11	SLA Escalation	Leave a request pending approval beyond the defined SLA window.	System automatically escalates the task and notifies the next-level approver.	Escalation triggered roughly 40 minutes after the SLA breach instead of immediately.	Fail
TC-12	CMDB Validation of Requested CI	Submit a request referencing an invalid or non-existent configuration item.	System flags the CI mismatch and blocks the request from proceeding to approval.	System correctly flagged the invalid CI and blocked progression to approval.	Pass
TC-13	Auto-Provisioning of Low-Risk Request	Submit a pre-approved, low-risk request (e.g., standard VPN access).	Request is automatically provisioned without a manual fulfilment step, and the CMDB is updated.	Request auto-provisioned successfully; CMDB record updated with new access details.	Pass
TC-14	Provisioning Failure & Retry	Simulate a network system/API failure during fulfilment.	System retries automatically and alerts the network team after repeated failures.	System retried twice and alerted the network team after the second failure, as expected.	Pass
TC-15	Notification on Approval / Rejection	Approve or reject a submitted request.	Requester receives an email/Teams notification reflecting the decision.	Email notification received; Teams notification was delayed by several minutes.	Fail
TC-16	SLA Dashboard Accuracy	Manager opens the SLA dashboard.	Open, in-progress, and overdue requests are displayed accurately and update in real time.	Dashboard counts matched the underlying request list; refreshed correctly.	Pass
TC-17	Audit Trail Report	Auditor generates an audit report for a completed request.	Report shows every approval and fulfilment action with the corresponding timestamp and user.	Report listed all approval and fulfilment actions with correct timestamps and user names.	Pass

Bug Tracking:

Bug ID	Bug Description	Steps to Reproduce	Severity	Status	Additional Feedback
BG-01	SLA escalation for pending approvals fires ~40 minutes late instead of immediately on SLA breach.	1. Submit a request requiring approval. 2. Let the approval task sit past the SLA deadline. 3. Observe the time the escalation notification is actually sent.	Medium	Open	Linked to TC-11. Suggest reviewing the SLA workflow's scheduled job interval.
BG-02	Teams notification on approval/rejection is delayed by several minutes versus the email notification.	1. Approve or reject a request. 2. Check email inbox (arrives promptly). 3. Check Teams channel (arrives late).	Low	Open	Linked to TC-15. Email path unaffected; likely a Teams connector/queue delay.
BG-03	Catalog item form label "Business Justification" is truncated on smaller screen widths.	1. Open Firewall Access Request catalog item. 2. Resize browser window / view on a smaller laptop	Low	Closed	Cosmetic issue; fixed by adjusting the form section's column width.

Bug ID	Bug Description	Steps to Reproduce	Severity	Status	Additional Feedback
		screen. 3. Observe the field label wrapping.			

Sign-off:

Tester Name: QA Tester, Project Team

Date: 21 Nov 2022

Signature: [Digitally Signed]

Notes:

- Test cases cover both positive and negative scenarios across the request, approval, and provisioning flows.
- Testers should record detailed feedback, including suggestions for improvement, alongside each result.
- Bug tracking should capture severity, status, and clear steps to reproduce for every defect found.
- Sign-off from both the project manager and product owner is required before deployment to production.
